Shipping Manifest (Last Mile) v.2.0

Version	Created by	Department
2.0	Héctor Furió	Client Integrations

Introduction

The API is designed to enable the integration of customer systems with CTT Express services. This API facilitates the declaration of shipments, providing a series of operations that allow managing all the information related to the manifest of last mile shipments.

The main purpose of this API is to automate the shipping process, reducing manual errors and improving logistics efficiency. It includes functionalities such as token authentication to ensure security, the creation of shipping manifests, and the specification of shipper and recipient information, as well as package details, pickup points, and additional services. Users can interact with this API to integrate shipment management directly into their platforms through a series of clearly defined endpoints.

Petition Details

Endpoint:

Test: https://api-test.cttexpress.com/integrations/manifest/v2.0/shippings

Prod: https://api.cttexpress.com/integrations/manifest/v2.0/shippings

Cabecera	Descripción
Content-Type	Must be application/json.
Authorization	Bearer authentication token. Example: Bearer YOUR_ACCESS_TOKEN.

Properties

Below is the list of attributes available to request a shipment to CTT Express:

Fields	Mandatory	Data type	Description
shipping_code	[]	string	Shipping Code
client_center_code	[x]	string	Center code of the client (provided by Ctt)
shipping_type_code	[x]	string	Service Type Code
department_code	[]	string	Client Department Code
client_bar_code	[]	string	Customer barcode
client_references	[]	string	Shipment Reference
shipping_weight_declared	[x]	decimal (2)	Shipping Weight (Kg)
item_count	[x]	int	Number of the items
custom_origin_name	[]	string	Label Origin Name
custom_origin_country_code	[]	string	Label Origin Country (Alpha-2 code)
custom_origin_postal_code	[]	string	Label Origin Postal Code
custom_origin_address	[]	string	Label Origin Address
custom_origin_town	[]	string	Label Origin Town
sender_name	[x]	string	Name of the sender
sender_country_code	[x]	string	Country of the sender (Alpha-2 code)
sender_postal_code	[x]	string	Postal code of the sender
sender_address	[x]	string	Address of the sender
sender_town	[x]	string	Town of the sender
sender_email_notify_address	[]	string	Email of the sender
sender_phones	[]	string	Mobile of the sender

recipient_name	**[x]**	**string**	**Name of the recipient**
recipient_country_code	**[x]**	**string**	**Country of the recipient (Alpha-2 code)**
recipient_postal_code	**[x]**	**string**	**Postal code of the recipient**
recipient_address	**[x]**	**string**	**Address of the recipient**
recipient_town	**[x]**	**string**	**Town of the recipient**

## additional_sub_code	**[]**	**string**	**Additional Sub Code**

Pickup Information Section

The Pickup Information Section allows you to provide details about the pickup arrangements for your shipment. This section includes the following fields:

- has_pickup_asap (string): Indicates whether a pickup is required at a non-standard origin location. Accepted values are "true" or "false".
- comments (string): Any additional comments or instructions regarding the pickup.
- date (string): The desired pickup date in the format YYYY-MM-DD.
- time (object): Specifies the preferred time window for the pickup.
    - min_hourminute (string): The earliest pickup time, in the format HH:mm.
    - max_hourminute (string): The latest pickup time, in the format HH:mm.

Guidelines for Using has_pickup_asap

- When to Set to "true":
    - If you require a pickup at an origin location that is not one of your usual facilities, set has_pickup_asap to "true".
    - The system will generate a pickup request at the origin specified in the sender parameters.
    - Use this option for ad-hoc pickups or when shipping from a new or temporary location.
- When to Set to "false":
    - If you are shipping from your standard origin warehouses with existing pickup arrangements, set has_pickup_asap to "false".
    - The system will not generate a new pickup request but will rely on the regular pickup schedule already established with your account representative.
    - This is the default setting for routine shipments from your usual locations.

Note: The has_pickup_asap field should only be set to "true" when a pickup is needed at a location outside of your regular pickup schedule. For all standard shipments from your usual facilities, leaving this field as "false" ensures a smooth process utilizing your prearranged pickup times.

Important Considerations for Pickup Date and Time

- Date and Time Validation:
    - If the date or time provided is outside the acceptable ranges specified by CTT Express, the system will adjust the manifest accordingly.
    - When has_pickup_asap is set to "true":
        - The manifest will be recorded with the earliest possible date and time accepted by CTT Express.

        - This ensures that your pickup request is scheduled at the soonest available opportunity, even if your preferred date or time is unavailable.
    - When has_pickup_asap is set to "false":
        - The system relies on your existing pickup arrangements, and any date or time provided will defer to the prearranged schedule.
- **Avoiding Scheduling Conflicts:**
    - To prevent any delays or misunderstandings, please ensure that the pickup date and time you provide fall within the operational hours accepted by CTT Express.
    - If you're unsure about the acceptable date and time ranges, please consult with your account representative or refer to the CTT Express guidelines.

Note: The automatic adjustment to the earliest possible date and time applies only when has_pickup_asap is set to "true". This feature helps facilitate prompt pickups from non-standard locations, even when the initially requested scheduling is not feasible.

To do this we have available an API that returns depending on Origin, Destination and the schedule of the request, the nearest day of collection, considering holidays and cut-off times, this doc is left below:

https://transfer.cttexpress.com/IT/export/integra/Api_Working_days.pdf

Example Usage

Scenario 1: Pickup at a Non-Standard Location with Date/Time Adjustment

You're shipping from a temporary site and need a pickup, but the date or time provided is outside the accepted range.

- has_pickup_asap: "true"
- comments: "Pickup at the temporary warehouse behind the main building."
- date: "2023-12-25" (If this date is a holiday or outside operational days, the system adjusts to the next available date)
- time:
    - min_hourminute: "22:00" (If outside operational hours)
    - max_hourminute: "23:00" (System will adjust to the earliest possible time within operational hours)

Result: The system schedules the pickup at the earliest possible date and time accepted by CTT Express.

Scenario 2: Regular Shipment from Usual Warehouse

You're shipping from your main warehouse with regular pickups.

- has_pickup_asap: "false"

- comments: "" (or any relevant notes)
- date: "2023-12-15"
- time: *Optional—can be omitted as the system will use your prearranged schedule*

Result: The system relies on your existing pickup arrangements without adjustments.

Summary

By following these guidelines:

- Use has_pickup_asap wisely to indicate when a special pickup is needed.
- Ensure date and time entries are within accepted ranges to avoid automatic adjustments.
- Understand that the system assists you by adjusting dates and times when necessary, ensuring pickups are not missed due to scheduling conflicts.

This approach helps maintain an efficient shipping process, whether you're using standard facilities or arranging pickups from new locations

Important information

This API can be used mainly in two ways, Online and Offline.

Description of the concepts

Online:

The customer must decide to use the CTT Express system to make the manifest by generating the shipment number by CTT Express, as well as relying on our servers to retrieve the label.

Offline:

When the Customer does not want to depend on our systems to generate the shipment number nor the label, they can use this same method, but they will change the mandatory parameters, as well as make their own label having the premise of not depending on our services to be able to label.

To generate the shipping numbers for Spain and Portugal, please check the doc:

https://transfer.cttexpress.com/IT/export/integra/Shipment_Number_Calculation_and_Package_Codes_of_CttExpress.pdf

Please contact the Customer Integration team to request the package ranges according to your needs.

In any of the two concepts it is strongly advised to implement a retry policy.

Parameters required as mandatory for Offline shipments:

Fields	Mandatory	Data type	Description
shipping_code	[x]	string	Shipping Code
## item_code	[x]	string	Ctt Express package code
##item_external_code	[x] Only in the case of	string	Package code of CTT Portugal

	shipments to Portugal
